

Wood Sage - *Teucrium scorodonia*

Description

Wood sage has oval heart-shaped, slightly grey-green leaves with a wrinkled texture that when crushed smell slightly of sage. The plant grows 30-60cm, with the small yellow-green flowers appearing on one side of a spike, all pointing in the same direction.

The species prefers thin, acid to neutral, dry and nutrient poor soils. The plant is found in various habitats, though most regularly in W8-11 and 15-17 woodland.

Soil regimes

Soil reaction (R)	4
Nitrogen availability (N)	3
